

## LEGENDS TO THE TABLE

- \* Pheromone component, chemically identified in the pheromone gland.
- ( ) Optimized blend for attraction in a field or a flight tunnel.
- [ ] The ratio identified in a pheromone extract.
- E Pheromone candidate estimated by the EAG study.
- N No field attraction data, or no field attractancy.

The chemical formulae are symbolized by

- 1) the number before the hyphen giving the position of double bond [ $Z = (Z)$ -configuration,  $E = (E)$ -configuration,  $\Delta =$  terminal] or the following functional groups in the chain,  
≡ = triple bond  
epo = *cis*-epoxy ring  
tepo = *trans*-epoxy ring  
Me = branched methyl group
- 2) the number before the colon giving the carbon atoms in the straight chain,
- 3) the words after the colon giving the functional groups as follows,  
H = hydrocarbon  
OH = primary alcohol  
OFo = formate of alcohol  
OAc = acetate of alcohol  
OPr = propionate of alcohol  
OBu = butyrate of alcohol  
OisoBu = isobutyrate of alcohol  
OisoVa = isovalerate (3-methylbutanoate) of alcohol  
ONO<sub>2</sub> = nitrate  
Ald = aldehyde  
one = ketone  
CN = nitrile  
Ate = ester of a long chain acid

(In the case of secondary alcohols and ketones, the position of the functional group is indicated by inserting the number before its symbol, such as 2-one for a carbonyl group at the 2-position. Terminal functional groups are indicated by the symbols without the number.)

Distribution information in Japan.

- A This species is distributed in Japan, and Japanese common name is shown in < >.
- B Sub-species is distributed in Japan.
- C Species in the same genus is distributed in Japan.
- D Species in this genus is not distributed in Japan.

**Number of Species Counted in the List of Lepidopterous Sex Pheromones and Attractants**  
**Revised on 2025. 2. 8**

(Pheromones produced by male moths are not counted.)  
 Number in parenthesis indicates the species distributed in Japan.
